AUSTRALIA

“NO DIG – KNOWHOW” THE FACTS

You need sunlight to grow vegetables – at least six hours a day. Erect your raised garden where it will capture as much sun as possible during winter while allowing for some protection from the blistering Australian sun in summer.

If there is no natural shade available (for example , a nearby tree or building, you can use shade cloth to protect the garden).

The big advantage of a raised garden is of course its organic content. The organic materials in compost, bark and cane straw for example help to retain moisture and makes your garden water efficient.

What are the advantages of your raised garden

- You can set it up anywhere and move with you. It can be placed anywhere in the backyard, on a balcony. on top of paving or concrete with adequate drainage
- Very little weeding and no back breaking shovelling
- The use of chemicals , herbicides and non organic fertilisers can be avoided
- You will spend less on vegetables
- It's a great way to relax
- Raising you garden up 200mm – 400mm high makes access easy

What do you do next? Purchase our **Long life Raised Garden Kits** or ask us how we can provide the materials to **personalise your own design** for a raised garden.
